

INFECTIONS OF THE BONES AND JOINTS

Malik Sallam, MD, PhD

INFECTIONS OF THE BONES AND JOINTS

- Two types of arthritis are associated with microbial

- ❖ Reactive arthritis

- ❖ Septic (infectious) arthritis.

the infection happened away from the injury site. (no microbes in the joint itself)

- Reactive arthritis is a **sterile** inflammation in the joint following a bacterial infection at a distant site in the body.

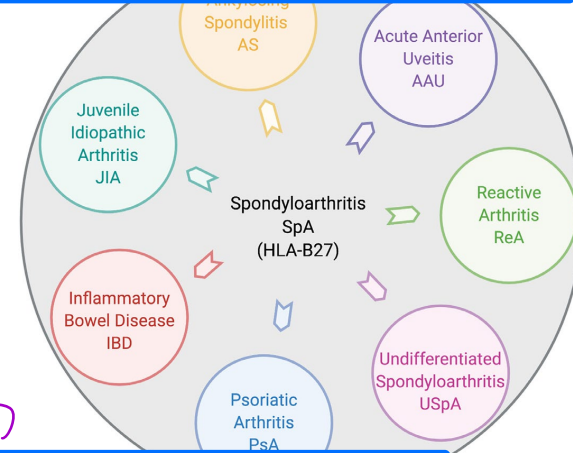

- Reactive arthritis (Reiter syndrome), results in urethritis, conjunctivitis, asymmetrical polyarthritis (e.g., ankles, knees, feet, and sacroiliitis), and a rash that occurs weeks after a bacterial infection.

- The most common cause of this type of arthritis is *Chlamydia trachomatis*. However, *Campylobacter jejuni*, *Yersinia enterocolitica*, *Shigella* or *Salmonella*, and *Streptococcus* cause reactive arthritis.

- It occurs more commonly in patients with **HLA-B27**.

Which of the following statements best describes why reactive arthritis is considered a sterile condition in spite of its association with pathogens?

Choice	Correct answer	Attempt answer
Its exclusive association with virus infections		
The condition affects joints only in immunocompromised individuals		
The joint inflammation occurs without microbial invasion of the joints	<input checked="" type="radio"/>	<input checked="" type="checkbox"/>

The most common pathogen implicated in reactive arthritis is

Choice	Correct answer	Attempt answer
Chlamydia trachomatis	<input checked="" type="radio"/>	<input checked="" type="checkbox"/>
Campylobacter jejuni		
Yersinia enterocolitica		
Shigella		
Salmonella		
Streptococcus		

BY

ETIOLOGY OF OSTEOMYELITIS

Profile	Common causes																		
Hematogenous	Usually only one organism																		
Infants	S. aureus, S. agalactiae (group B Streptococcus), E. coli																		
Children (1–16 years)	S. aureus, S. pyogenes (group A Streptococcus), H. influenzae																		
>16 years	<div><p>Which of the following pathogen profiles is most likely to be implicated in osteomyelitis in a 4-month-old infant?</p><table><thead><tr><th>Choice</th><th>Correct answer</th><th>Attempt answer</th></tr></thead><tbody><tr><td>Streptococcus pyogenes, Haemophilus influenzae, Staphylococcus aureus</td><td></td><td></td></tr><tr><td>Staphylococcus aureus, Streptococcus agalactiae, Escherichia coli</td><td>✓</td><td>✓</td></tr><tr><td>Serratia marcescens, Staphylococcus epidermidis, Staphylococcus aureus</td><td></td><td></td></tr><tr><td>Proteus mirabilis, Bacteroides fragilis, Peptostreptococcus</td><td></td><td></td></tr><tr><td>Staphylococcus aureus, Campylobacter jejuni, Salmonella enterica</td><td></td><td></td></tr></tbody></table></div>	Choice	Correct answer	Attempt answer	Streptococcus pyogenes, Haemophilus influenzae, Staphylococcus aureus			Staphylococcus aureus, Streptococcus agalactiae, Escherichia coli	✓	✓	Serratia marcescens, Staphylococcus epidermidis, Staphylococcus aureus			Proteus mirabilis, Bacteroides fragilis, Peptostreptococcus			Staphylococcus aureus, Campylobacter jejuni, Salmonella enterica		
Choice		Correct answer	Attempt answer																
Streptococcus pyogenes, Haemophilus influenzae, Staphylococcus aureus																			
Staphylococcus aureus, Streptococcus agalactiae, Escherichia coli		✓	✓																
Serratia marcescens, Staphylococcus epidermidis, Staphylococcus aureus																			
Proteus mirabilis, Bacteroides fragilis, Peptostreptococcus																			
Staphylococcus aureus, Campylobacter jejuni, Salmonella enterica																			
Contiguous spread																			
Diabetic foot																			

ETIOLOGY OF OSTEOMYELITIS

Profile	Common causes																		
Hematogenous	<div><p>A 77-year-old male diabetic patient presented with osteomyelitis of the foot and has a history of uncontrolled diabetes. Which of the following organisms is least likely to be involved in this case of diabetic foot osteomyelitis?</p><table><thead><tr><th>Choice</th><th>Correct answer</th><th>Attempt answer</th></tr></thead><tbody><tr><td>Pseudomonas aeruginosa</td><td></td><td></td></tr><tr><td>Staphylococcus aureus</td><td></td><td></td></tr><tr><td>Prevotella species</td><td></td><td></td></tr><tr><td>Haemophilus influenzae</td><td><input checked="" type="checkbox"/></td><td><input checked="" type="checkbox"/></td></tr><tr><td>Peptostreptococcus</td><td></td><td></td></tr></tbody></table></div>	Choice	Correct answer	Attempt answer	Pseudomonas aeruginosa			Staphylococcus aureus			Prevotella species			Haemophilus influenzae	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Peptostreptococcus		
Choice		Correct answer	Attempt answer																
Pseudomonas aeruginosa																			
Staphylococcus aureus																			
Prevotella species																			
Haemophilus influenzae	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>																	
Peptostreptococcus																			
Infants																			
Children (1–16 years)																			
>16 years																			
Contiguous spread																			
Diabetic foot	<p><u>S. aureus</u>, <u>Streptococcus</u>, Enterococcus, gram-negative rods (e.g., Proteus mirabilis, Pseudomonas), anaerobes (e.g., <u>Prevotella</u>, Bacteroides, Fusobacterium, <u>Peptostreptococcus</u>)</p>																		

A 35-year-old intravenous drug user presents with fever and neck pain. Imaging reveals osteomyelitis of the cervical spine. Which of the following is the most likely microbial etiology in this case?

Choice	Correct answer	Attempt answer
Contamination from athletic footwear with <i>Staphylococcus aureus</i> colonization and infection		
Bacteremia in intravenous drug use favors seeding of cervical vertebrae with <i>Pseudomonas aeruginosa</i>	✓	✓
Peripheral vascular disease in intravenous drug users leads to anaerobic bone infections		
Repeated injections increase local joint infections with Coagulase-negative <i>Staphylococci</i>		
Intravenous drug user often acquire fungal osteomyelitis due to contaminated syringes		

OSTEOMYELITIS

- Some patients are more likely to develop a particular bacterial osteomyelitis because of their predisposition to certain factors/behaviors.

IDUs are more likely to acquire *P. aeruginosa* infections of the cervical vertebrae.

- Athletic shoes are more likely to harbor increased numbers of *P. aeruginosa* and *S. aureus*. Therefore, puncture wounds to the feet of persons wearing these shoes are more likely to result in infections due to *P. aeruginosa* or *S. aureus*.
- Diabetic patients with peripheral vascular disease can develop OM as mentioned earlier.
- Osteomyelitis in patients with sickle cell disease is most likely due to *S. aureus* and *Salmonella*.
- Infections of prosthetic joints are most commonly due to CoNS (e.g., *S. epidermidis*); the second most common cause of these infections is *S. aureus*.

OSTEOMYELITIS – DIAGNOSIS

- ESR & CRP: Elevated in both acute and chronic cases
- Magnetic resonance imaging (MRI) is the imaging modality with greatest sensitivity for diagnosing osteomyelitis
- The preferred diagnostic criterion for osteomyelitis is a positive bacterial culture from bone biopsy, but clinical, laboratory, and radiographic findings can also inform a clinical diagnosis.

Which imaging modality is the most sensitive for the early detection of osteomyelitis?

Choice	Correct answer	Attempt answer
Ultrasound		
Plain radiograph		
CT scan		
Bone scan		
MRI		

OSTEOMYELITIS – TREATMENT

- **Antibiotic therapy**

- Acute OM: 4–6 weeks of antibiotics; surgery usually not needed
- Chronic OM: Surgery usually required

- **Antibiotic by pathogen:**

- MSSA: Nafcillin or Oxacillin
- MRSA: Vancomycin
- Streptococcus spp.: Penicillin G
- Gram-negative rods: Ciprofloxacin
- Pseudomonas: Piperacillin-tazobactam + Gentamicin
- Anaerobes: Clindamycin or Metronidazole

Which of the following is the recommended antibiotic regimen for osteomyelitis caused by *Pseudomonas aeruginosa*?

Choice	Correct answer	Attempt answer
Vancomycin		
Penicillin G		
Clindamycin		
Piperacillin-tazobactam	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

SEPTIC ARTHRITIS

- Fungi, mycobacteria, and bacteria can all cause infectious arthritis. However, bacterial infectious arthritis causes the most injury. Bacterial (septic) arthritis is a serious infection, and if not treated quickly, can result in significant permanent damage to the joint and disability.

SEPTIC ARTHRITIS – ETIOLOGY

- Most Common Causes:
- All ages: Staphylococcus aureus (most common overall)
- Young, sexually active adults: Neisseria gonorrhoeae (Gonococcal arthritis)
- Elderly: Gram-negative bacilli (e.g., E. coli, Proteus, Serratia)
- Other Pathogens:
- Streptococcus spp. (20%): S. pneumoniae group
- Anaerobes: Rare; usually post-trauma

A 77-year-old man with recent hospitalization for urosepsis presents with fever and acute mono-arthritis. Which of the following best describes the most likely causative pathogen based on his age and clinical background?

Choice	Correct answer	Attempt answer
Streptococcus pyogenes due to increased mucosal colonization		
Staphylococcus aureus due to IV catheter use in the elderly		
Neisseria gonorrhoeae due to age-related immune decline		
Escherichia coli due to bacteremia from a urinary source	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Anaerobic bacteria due to chronic joint disease		

SEPTIC ARTHRITIS — DIAGNOSIS

- Diagnostic Workup
- ① ▪ Synovial Fluid Analysis (Critical Test):
 - Perform: WBC count, Gram stain, and culture
 - Helps distinguish: Noninflammatory, Inflammatory, Septic arthritis
- ② ▪ Blood cultures: Positive in many cases
- ③ ▪ Suspected gonococcal arthritis: Collect pharyngeal, rectal, cervical, or urethral swabs
- ④ ▪ Culture on Thayer-Martin media

A 22-year-old Australian sexually active female presented with fever, polyarthrititis, and scattered pustular skin lesions. Synovial fluid analysis was negative for organisms on Gram stain and culture. Which of the following next steps is most appropriate to confirm the suspected diagnosis?

Choice	Correct answer	Attempt answer
Repeat joint aspiration and send for acid-fast bacilli staining		
Start empiric antifungal therapy and perform fungal cultures		
Obtain blood cultures and swabs from mucosal sites for culture on Thayer-Martin media	<input checked="" type="radio"/>	<input checked="" type="checkbox"/>
Perform a bone biopsy to evaluate for osteomyelitis		

SEPTIC ARTHRITIS – TREATMENT AND PREVENTION

- Nongonococcal (e.g., *S. aureus*, *Streptococcus*):
- Joint drainage & lavage (arthroscopy/surgery)
- IV antibiotics based on Gram stain/culture
- Duration: 3–4 weeks
- Poor outcomes in elderly, prosthetic joints, or preexisting joint disease
- Prevention: Prompt treatment of UTIs, SSTIs, pneumonia
- Avoid joint trauma

SEPTIC ARTHRITIS – TREATMENT AND PREVENTION

- Gonococcal (*N. gonorrhoeae*):
- Drain joint, then IV ceftriaxone until improvement (24–48 hrs)
- Oral antibiotics (cefixime, ciprofloxacin, etc.) to complete 7–10 days
- Residual joint damage is rare
- Prevention:
- Safe sex practices
- Identify & treat infected partners

استنتاج 3

Choice	Correct answer	Attempt answer
Which of the following clinical findings is most characteristic of disseminated gonococcal infection in septic arthritis?		
Monoarticular arthritis with positive synovial fluid culture		
Polyarthritis with tenosynovitis and pustular skin lesions	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Bilateral sacroiliac joint pain with high-grade fever		
Erythema migrans and arthralgia after a tick bite		

THANK YOU!
