In this lecture , you should know the structure of :

- The **trophozoite** and the **cyst** of each **Protozoa**.
- The **egg** and the **worm** of each **Helminths**.
- The information mentioned besides each picture.

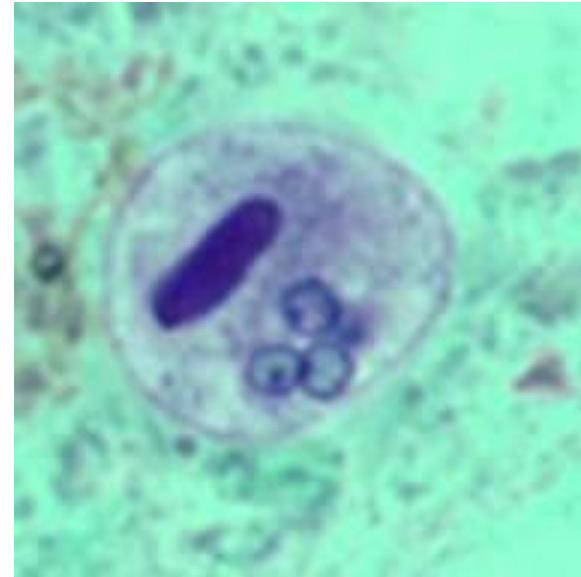

Entamoeba histolytica

Trophozoite

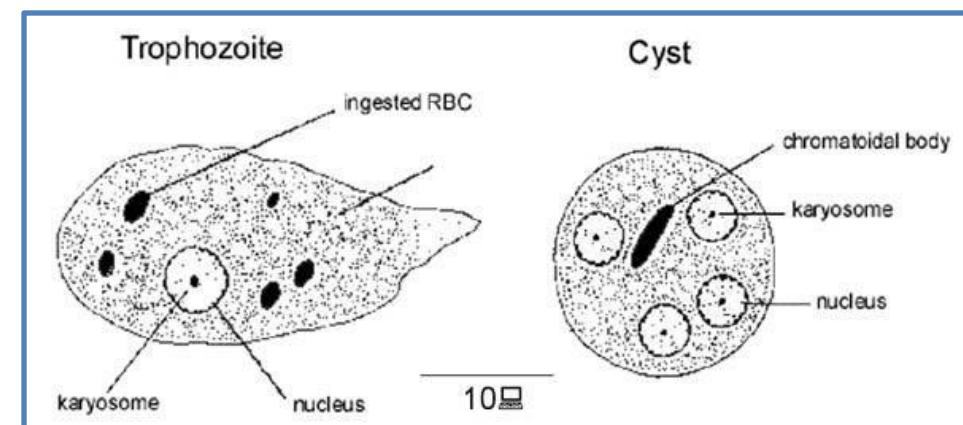

- trophozoites
- 15-20 μm
- extended pseudopodia
- progressive movement

Cyst

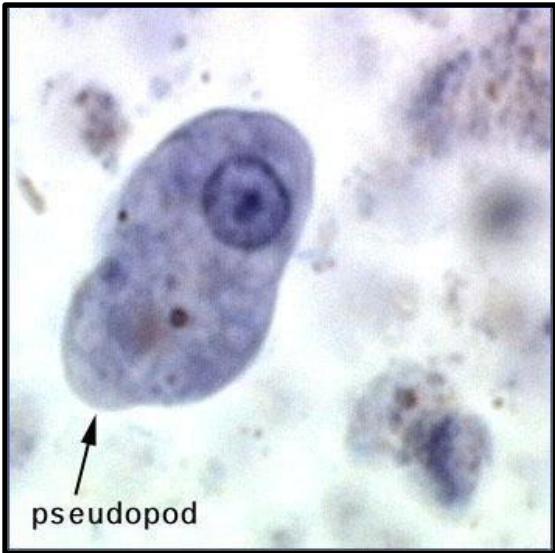

- cysts
- 12-15 μm
- 4 nuclei (mature)
- blunt chromatoid bodies

- *Entamoeba histolytica* is a protozoa , class pseudopodia.
- Trophozoite is oval in shape and larger than the cyst and they have different nuclei and chromatin bodies number.

Entamoeba Coli

Trophozoite

- trophozoites
- 20-25 μm
- broad blunt pseudopodia

Cyst

- cysts
- 15-25 μm
- 8 nuclei (mature)
- pointed chromatoid bodies (less prominent)

➤ Differentiate between *E. histolytica* and *E. coli* in the number of the nuclei and the chromatin bodies.

Entamoeba coli

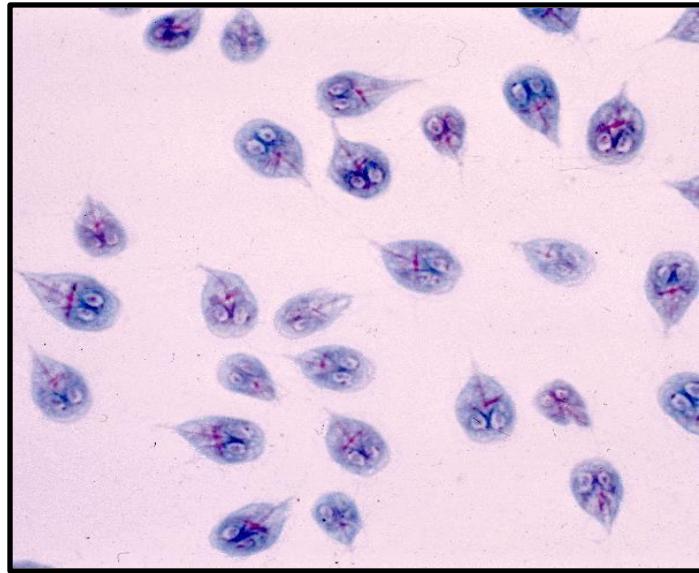

Cyst

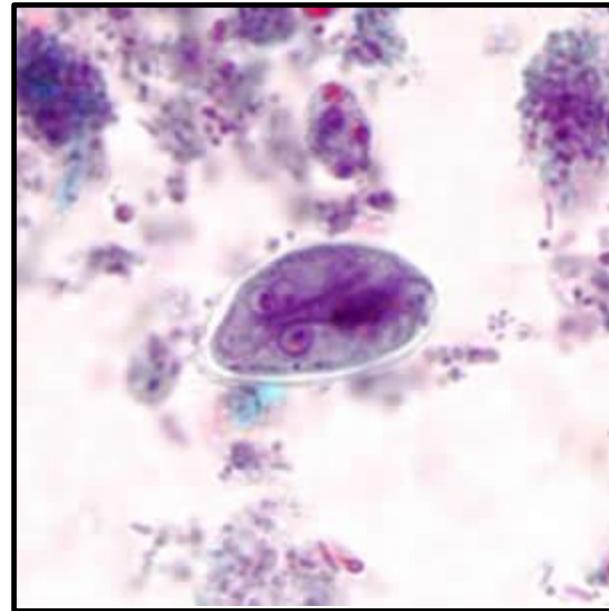

Trophozoite

Giardia lamblia

Trophozoite

Cyst

- *Giardia lamblia* is a protozoa, class flagellate.
- Leaf or owl shaped with two prominent nuclei.
- Cyst → flagella is internal.
- Trophozoite → flagella is external.

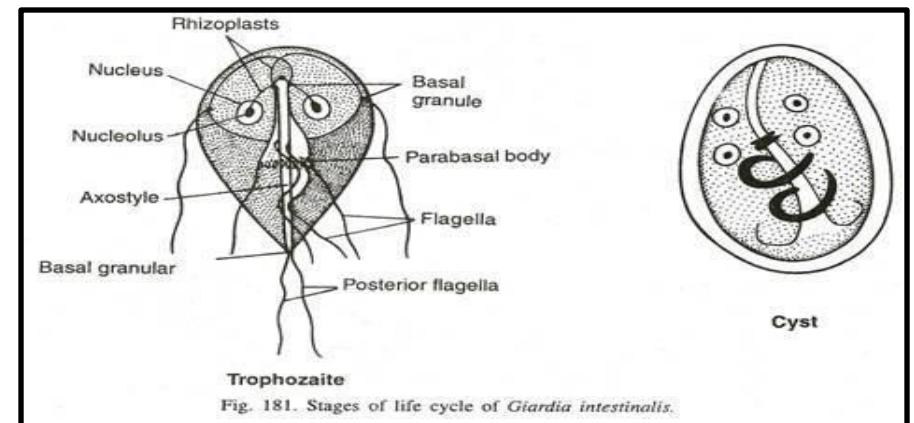

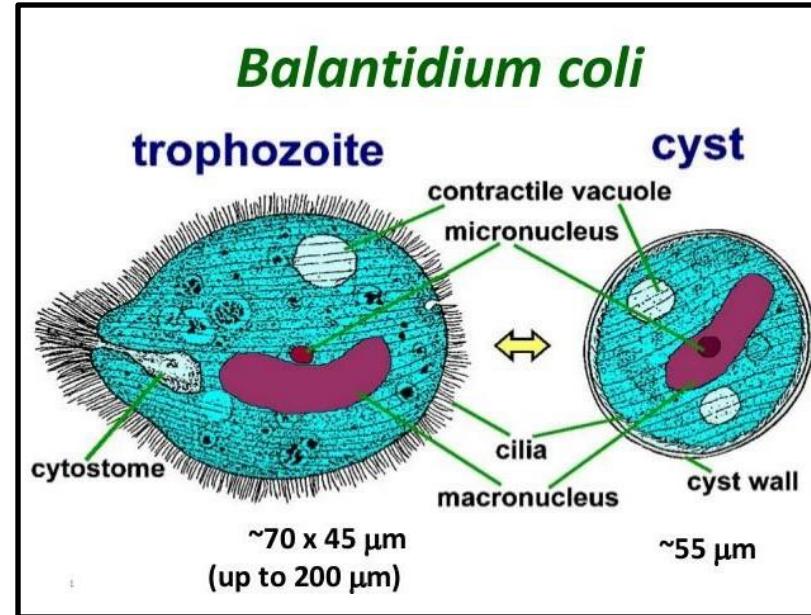

Fig. 181. Stages of life cycle of *Giardia intestinalis*.

Balantidium coli

Trophozoite

Cyst

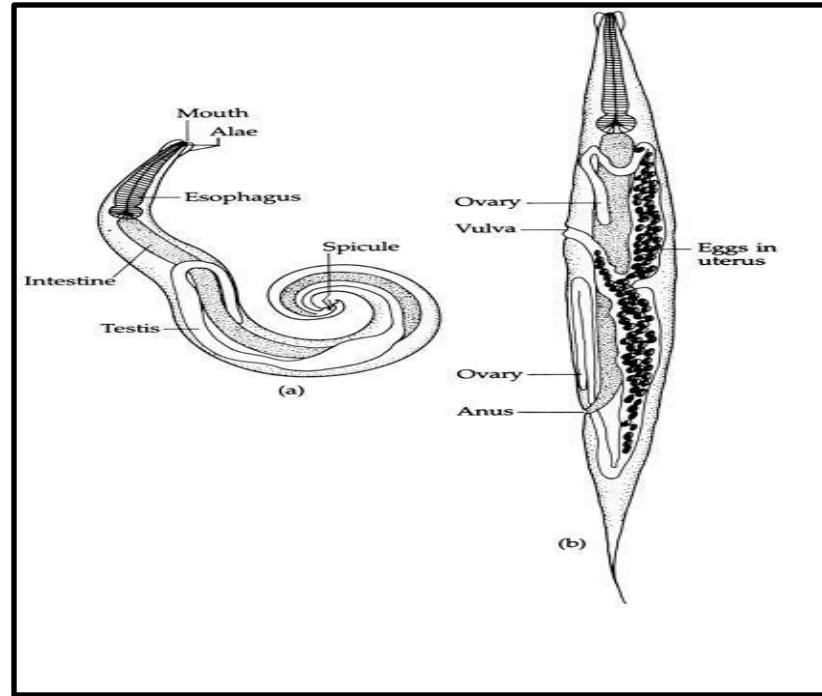

- ***Balantidium coli*** is a protozoa, class cilia.
- Trophozoite and cyst differ in the structure of cilia
- (short and uniform cilia all over the wall of the trophozoite, but invisible or retracted in the case of the cyst).
- It's special for the kidney shaped nucleus.

Enterobius Vermicularis (Nematode)

Worm

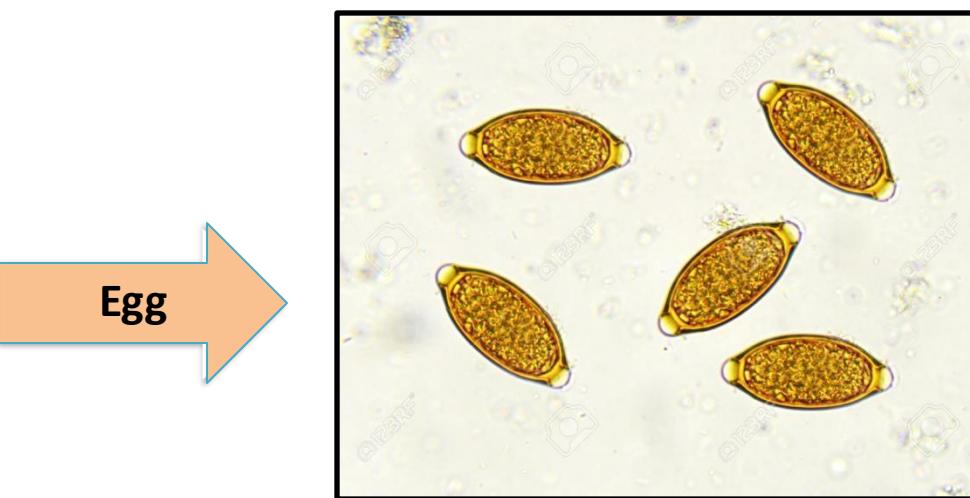

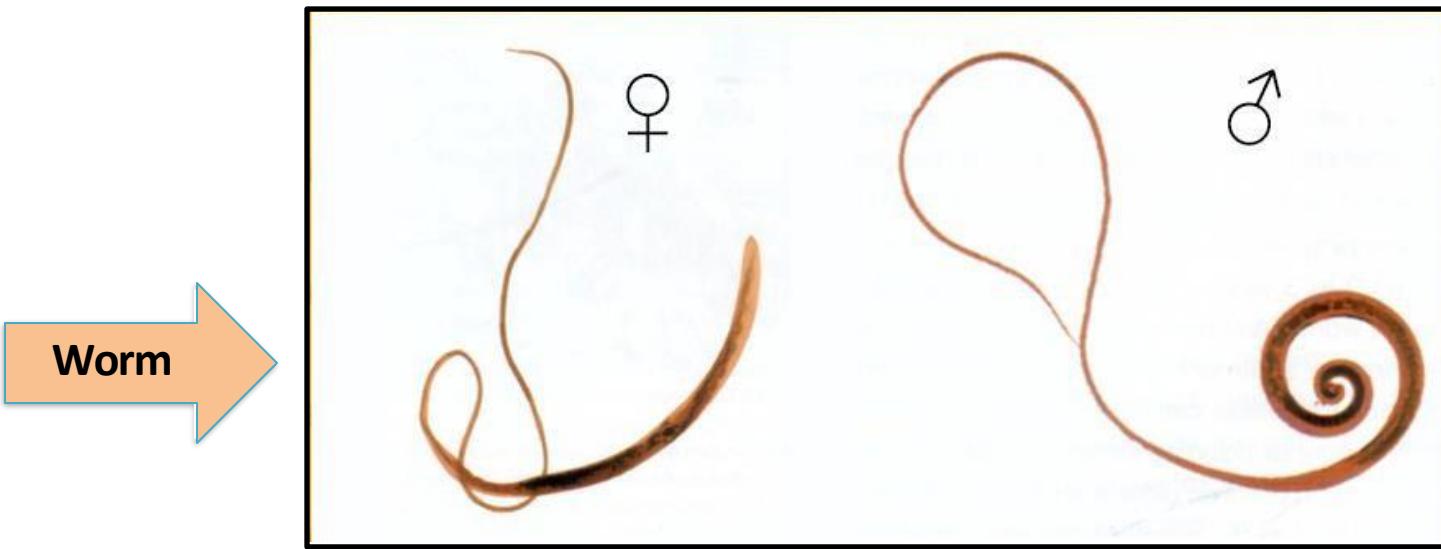

Egg

- ***Enterobius vermicularis*** is a helminths, phyla nematode (roundworm) thin and thread- like.
- The egg is D-shaped.

Trichuris Trichiura

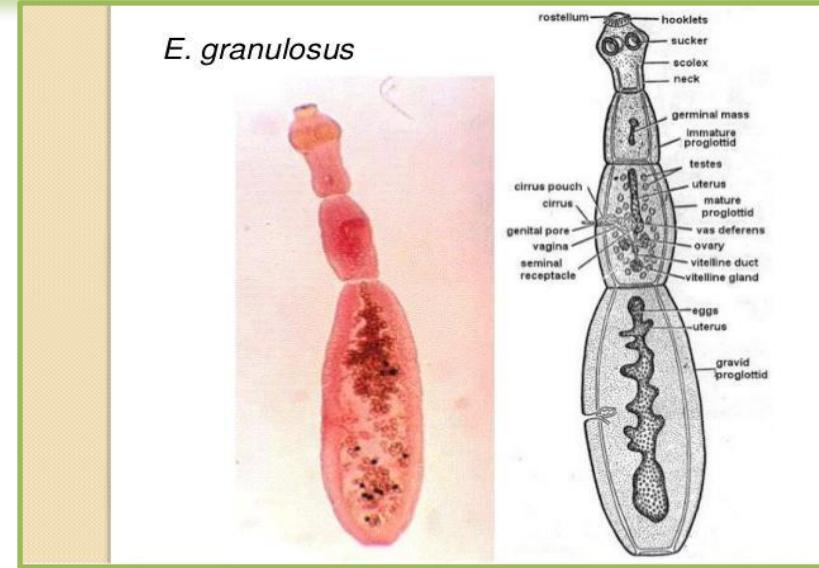

- Trichuris trichiurus is a nematode (roundworm).
- Commonly known as the whipworm due to its whip-like shape.
- The egg is barrel-shaped with two poles resembling 'handles'.

Echinococcus granulosus (cestode)

Ova

- *Echinococcus granulosus* is a cestode (platyhelminths).
- The worm is short compared to *Ascaris lumbricoides* and others and it's segmented (different types of proglottids).

Worm

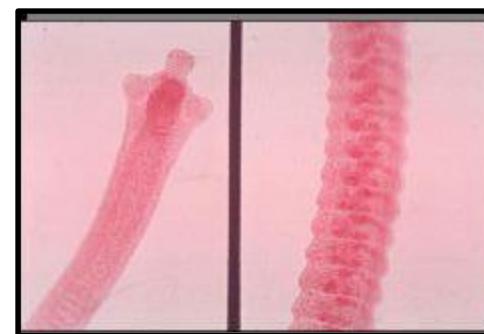

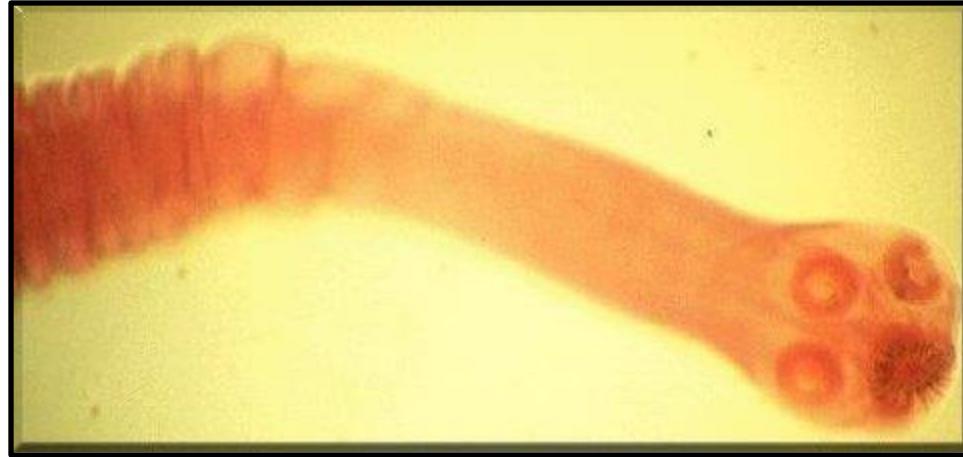

In cestodes, the body is made up of segments called proglottids. These proglottids go through stages of maturity:

- Immature proglottids
- Mature proglottids
- Gravid proglottids (Doctor mentioned this type)

Hymenolepis Nana (Cestode)

Ova

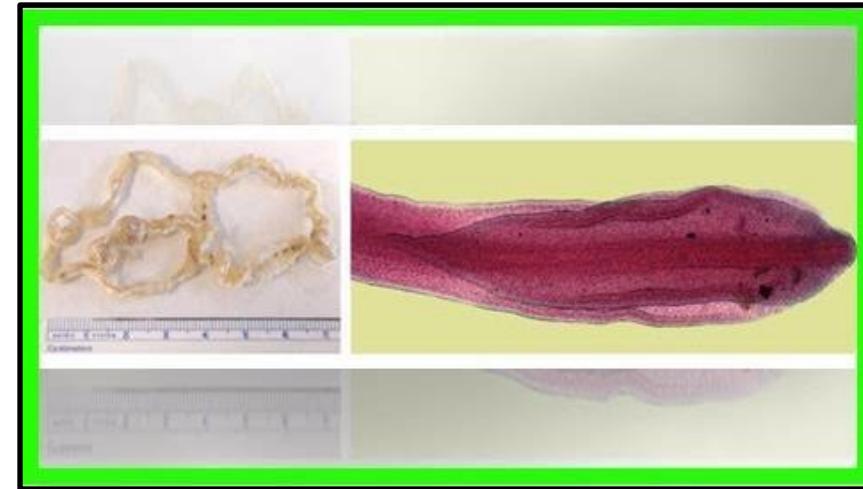

- ***Hymenolepis nana*** is a cestode (Platyhelminthes).
- Notice the scolex (the head of the worm) that contains hooks.

Worm

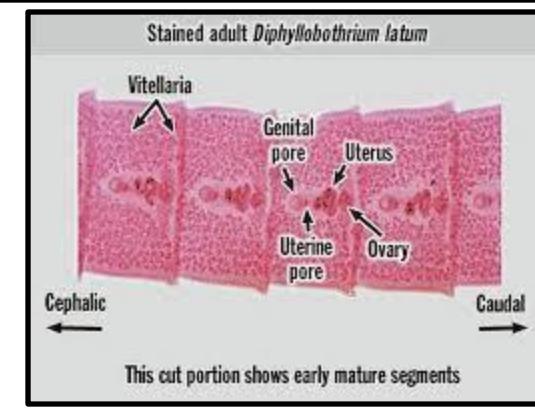

Diphyllobothrium latum(Cestode)

Egg

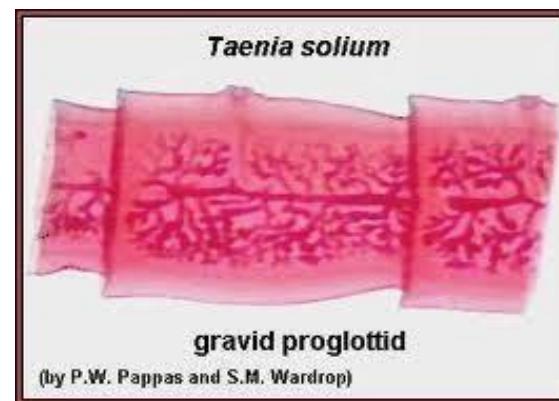

Notice the
segments
(gravid).

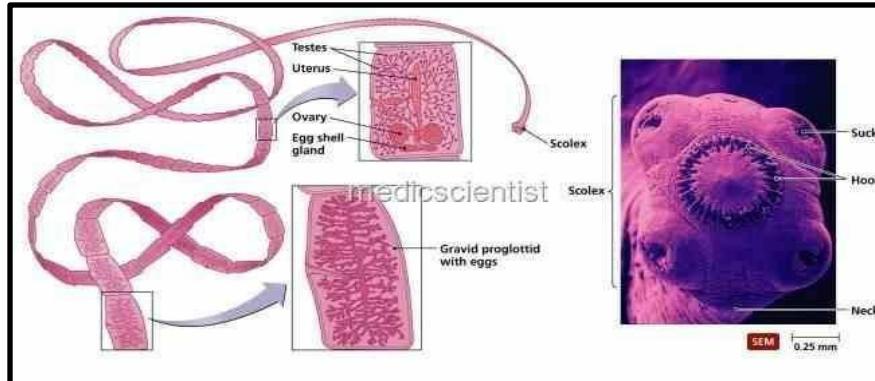

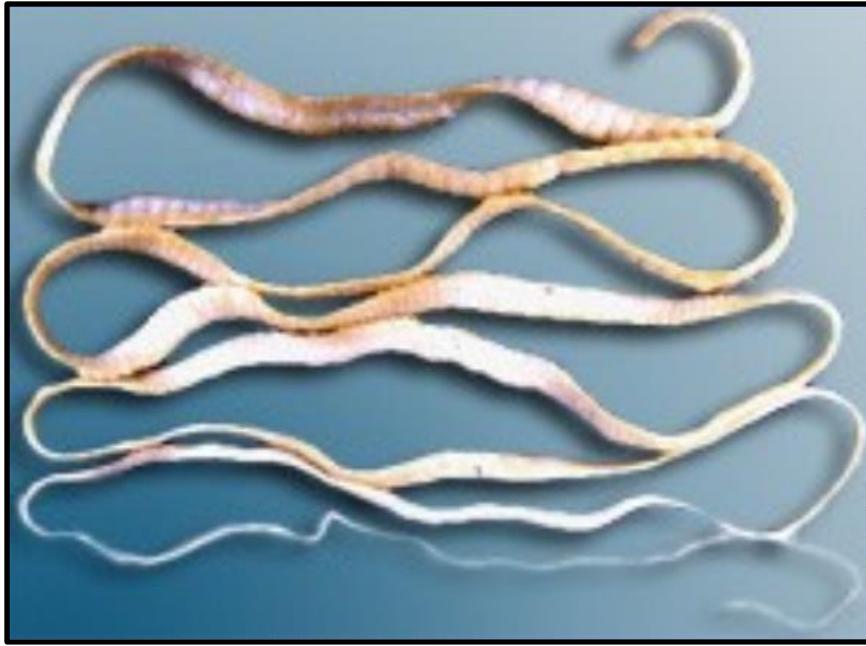

Worm

Taenia solium (Cestode)

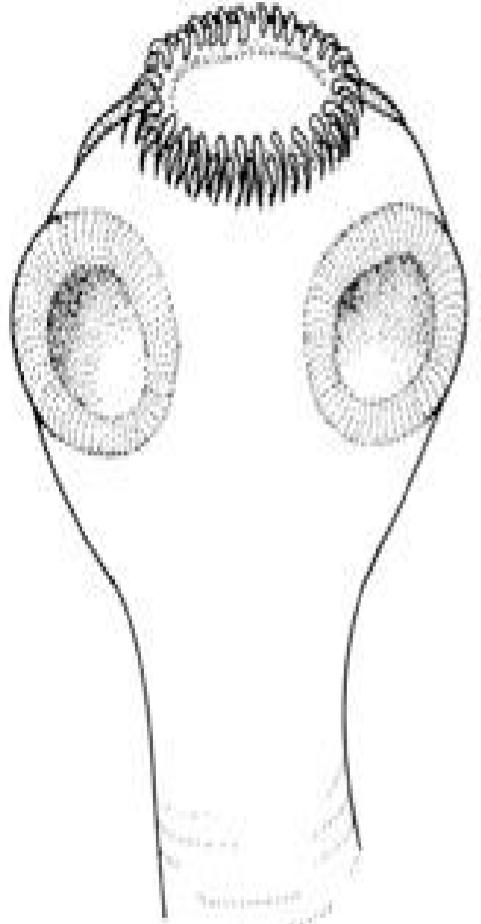

Found in pork meat

Taenia saginata (Cestode)

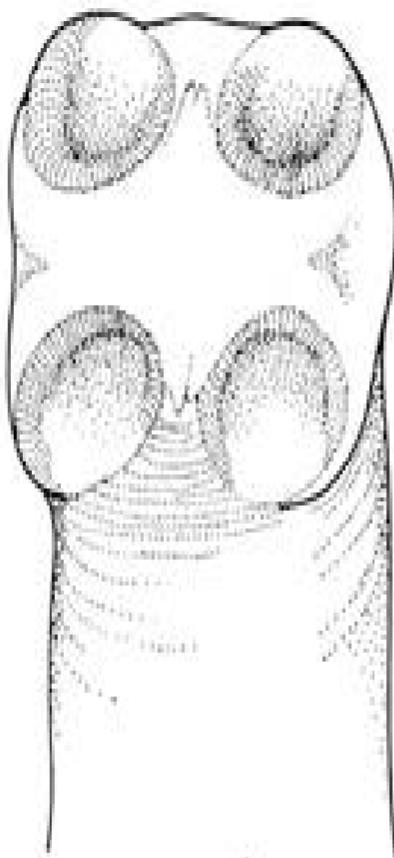

Found in beef

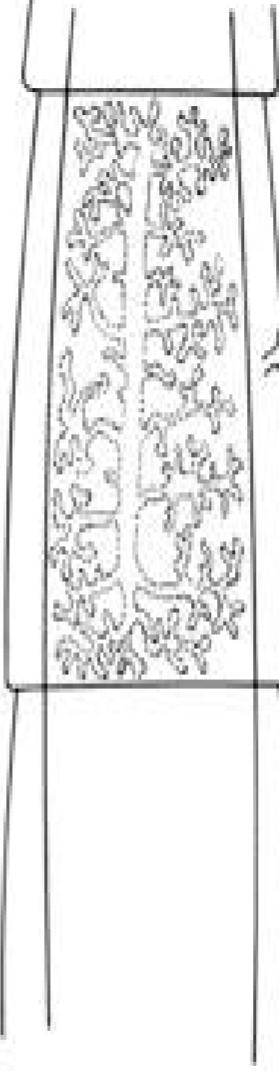

Taenia solium

(a)

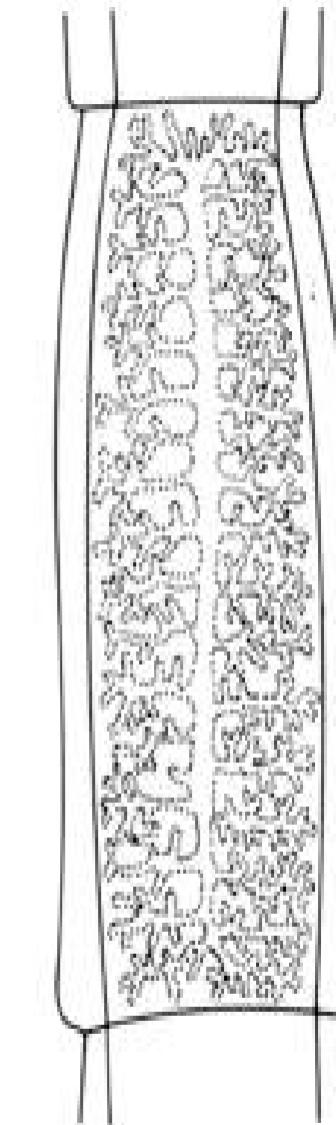

Taenia saginata

Scolex comparison

Taenia solium

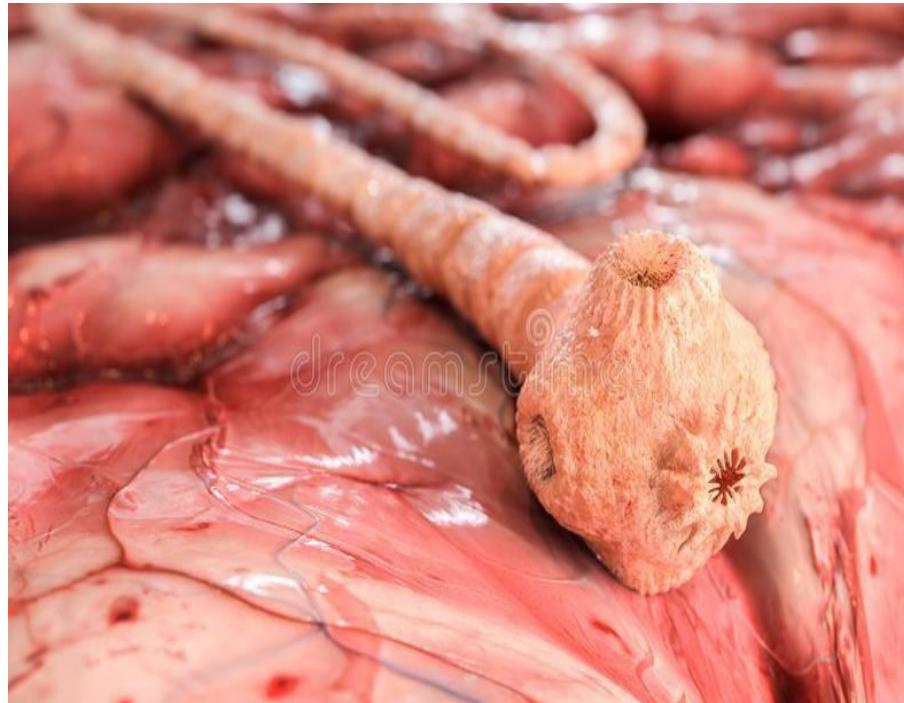

(b)

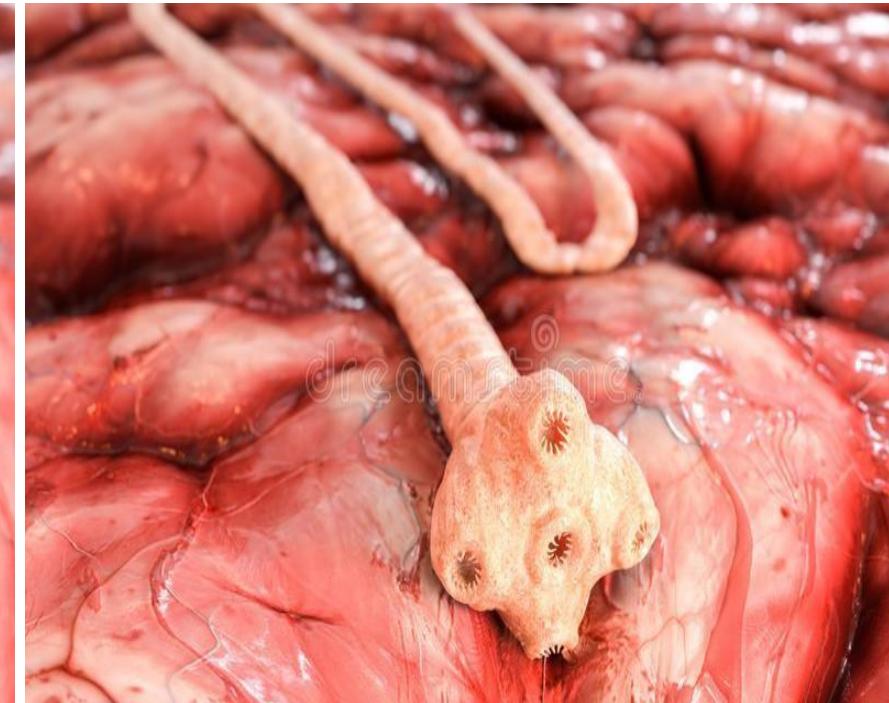

Taenia saginata

Gravid comparison

Taenia Solium

Taenia saginata

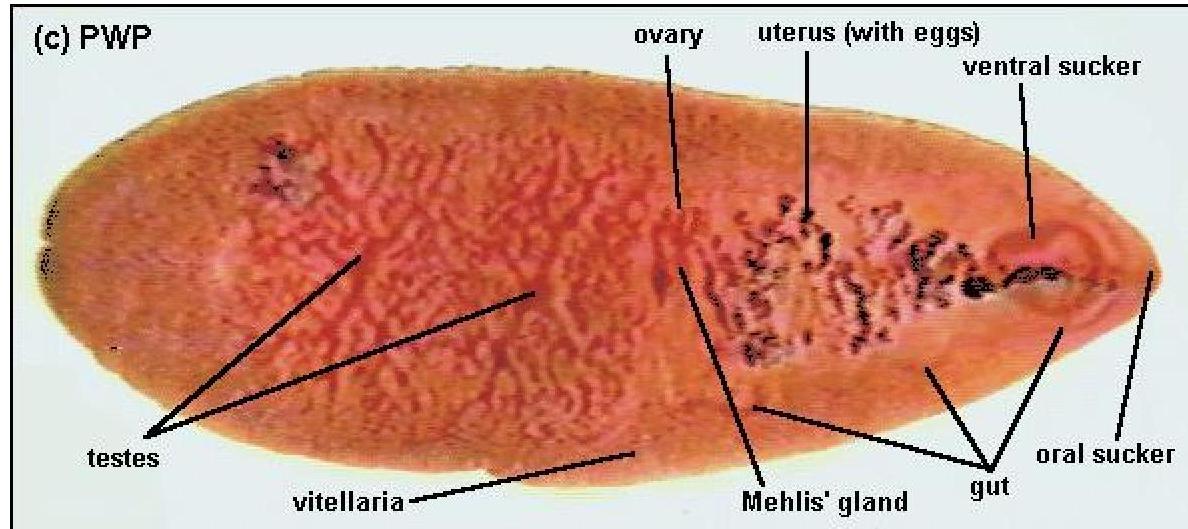

Electron microscope images.

Taenia solium VS. *Taenia saginata*

	<i>Taenia solium</i>	<i>Taenia saginata</i>
Where it's found	Pork	Beef
Scolex (the head)	Has suckers and hooks	Has suckers without hooks
Graavid (uterus and eggs)	Shorter	Longer

fasciolosis buski (Trematode)

Worm

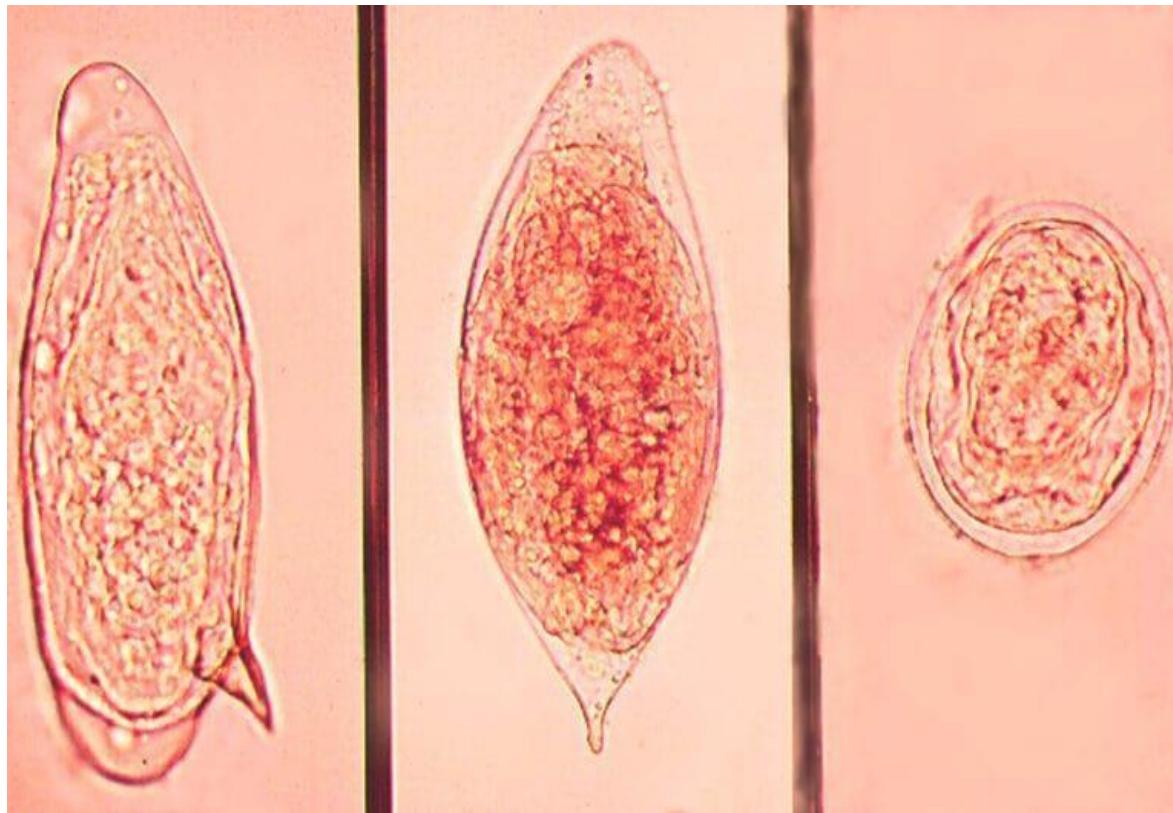

Egg

- ***Fasciolopsis buski*** is a trematode that is leaf-like shaped.
- It is very big and can be seen with the naked eye.
- The egg has an **operculum** which is a cap-like lid at the end.

Schistosoma (Trematode)

*Schistosoma
mansoni* (stool)

*Schistosoma
haematobium* (urine)

*Schistosoma
japonicum* (stool)

- Spine location of each egg:
 - S. mansoni*: lateral spine.
 - S. haematobium*: terminal spine.
 - S. japonicum*: small spine (hard to see).

Thank you for listening!

رسالة من الفريق العلمي:

اللَّهُمَّ اغْفِرْ لِي ذَنْبِي كُلَّهُ: دِقَّهُ وَجِلَّهُ، وَأَوَّلَهُ وَآخِرَهُ، وَعَلَانِيَتَهُ وَسِرَّهُ.

اللهم اجعلني ممن وفقته لاغتنام العشر، وكتبت له فيها الخير كله، وبلغته يوم عرفة وهو راضٍ عنِّي.

"ما من أيام العمل الصالح فيها أحب إلى الله من هذه الأيام، قالوا: يا رسول الله ولا الجهاد في سبيل الله؟ قال: ولا الجهاد في سبيل الله، إلا رجل خرج بنفسه وماله ثم لم يرجع من ذلك بشيء" رواه البخاري.

لا تسونوا وأهل غزة من دعائكم

الله أكبر.. الله أكبر.. الله أكبر

لا إله إلا الله

الله أكبر.. الله أكبر

ولله الحمد
